	est Report			
Title: Model 4100 Pocket Programmer Conducted Transmit Power Output Report				
Document Number and Revision: EERE 0625 Revision 1.2	Page 1 of 4			
Prepared By: Dave Petsko	Approved By:			

1. Purpose

FCC Rules §2.1046 requires the conducted measurement of transmitter power output be included in the EMC test report documents submitted to the FCC for product certification. This document describes the RF Test Method and Conducted Transmit Power Output Test Results for Pocket Programmer (POP), Model 4100.

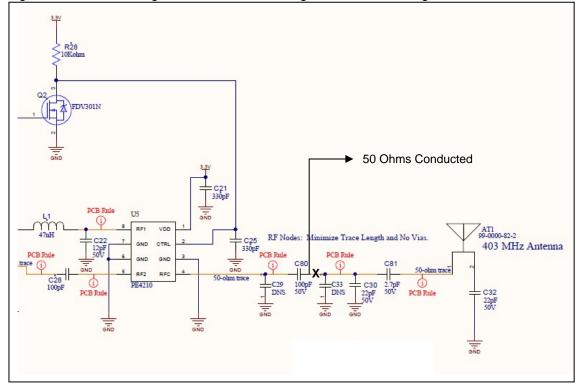

2. References

- 47 CFR § 2.1046(a)
- DS-0000-77-2 Torpedo Pocket Programmer Schematic
- AP-0000-97-2 ASBY PCB Torpedo Pocket Programmer

3. RF Test Method

The 402-405 MHz conducted transmit power output of the Pocket Programmer, Model 4100 may be measured directly by attaching a Murata MM8130-2600 coaxial connector with switch to the 50 Ohms I/O point of the PCB (AP-0000-97-2 ASBY PCB Torpedo Pocket Programmer) as shown in Figure 1.

Figure 1- Schematic Diagram of Antenna Matching Circuit, Pocket Programmer, Model 4100

Test Report

Title:

Model 4100 Pocket Programmer Conducted Transmit Power Output Report

Document Number and Revision: Page 2 of 4

EERE 0625 Revision 1.2

The connector body (ground terminal) was soldered to the PCB ground flood area adjacent to capacitor C50. Capacitors C30 and C31 were positioned upright (tombstone) such that C50 was disconnected from the antenna (AT1) matching components. The connector center conductor (hot terminal) was soldered to the PCB trace adjacent to the output end of capacitor C50 (See the schematic location marked X).

Note: Attachment of the coaxial connector to the PCB assembly should be done by a trained electronics technician to allow for proper soldering and prevention of undue stress on the PCB solder connection (I.e. PCB pad area damage may easily occur).

The PCB is then connected to a spectrum analyzer via coax cable for measurement of transmitter conducted power output.

4. Equipment Used

Table 1 - List of Test Equipment

Equipment	Mfg.	Model	Cal ID	Cal Due
Spectrum Analyzer	Rohde Schwartz	FSL6	10055	8 NOV 2014
Coax Cable*	Johnson/Emerson	415-0033-012	NA	NA

5. Sample Information

A single sample was used for the Conducted Transmit Power Output Test as described in Table 2 below.

Table 2 – Sample Used

	PoP Sample 1	
PCB Serial Number	0023	
PoP Serial Number [EXID]	0x00001D	
DBR [includes all HW revisions]	1613	
SW Version	Custom EMC Test Software \Torpedo\Software\PoP\RadioTest, MKS Checkpoint 1.4	

5.1. Sample Traceability

Traceability records are defined for the sample including workflow/traveler, which includes reference to BOM revision, manufacturing procedures with revision number and component lot or serial numbers. A description of the methods and processes used to assemble/process the materials are recorded in the Minnetronix Development Build Record (DBR) so that the method and processes can be repeated if necessary. The DBR incorporates:

- DA-0001-89-7 ASBY Assembly Procedure for Torpedo PoP Pocket Programmer
- Revision information for BOMs
- Supplements for updates (e.g. software changes, any rework, etc.)

5.2. Sample Retention

Sample is retained at QIG's Cleveland facility.

6. Transmitter Power Output Test Results

Test Report

Titla:

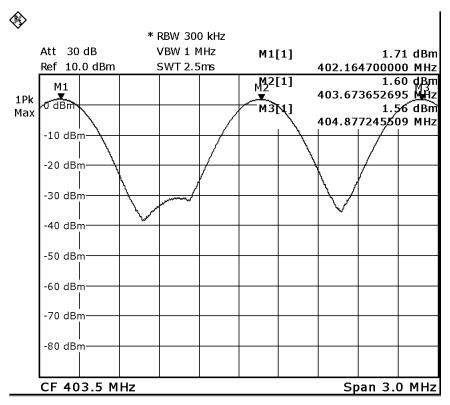

Model 4100 Pocket Programmer Conducted Transmit Power Output Report

Document Number and Revision: Page 3 of 4

EERE 0625 Revision 1.2

The 402-405 MHz transmitter measured conducted power output data was recorded for low, medium, and high RF channels selected. The test results are shown in Figure 2 and recorded in Table 3. Test limits are not applicable per FCC §2.1046 requirements.

Figure 2 - Conducted Transmitter Power, Pocket Programmer, Model 4100

Date: 23.MAY.2014 13:47:37

Table 3 - Pocket Programmer, Model 4100, Conducted Transmit Power Output

Transmit Power Setting 52	Channel 0	Channel 5	Channel 9
Frequency (MHz)	402.15	403.65	404.85
Power Output (dBm)	2.01	1.90	1.86

^{*} Coax Cable Insertion Loss - 0.3 dB
